DevOps Cheat Sheet:

100+ Most Used Commands & Concepts

Introduction

DevOps is all about unifying development and operations to deliver software faster, reliably, and securely. This cheat sheet covers the **most common DevOps commands and practices** across Linux, Git, Docker, Kubernetes, CI/CD, and more.

Whether you're debugging in production, setting up CI pipelines, or deploying to Kubernetes, these commands are your **everyday toolbox**.

1. Linux Essentials

Linux is the backbone of DevOps. These commands are used for navigation, file management, and system monitoring.

Command	Description
<code>ls -l</code>	List files with details
<code>pwd</code>	Print working directory
<code>cd /path</code>	Change directory
<code>cp src dest</code>	Copy file
<code>mv src dest</code>	Move or rename file
<code>rm -rf dir</code>	Delete file/dir
<code>cat file</code>	Show file content
<code>tail -f log.txt</code>	Stream logs
<code>free -h</code>	Show memory usage

Command	Description
<code>top</code>	Show running processes

2. Git (Version Control)

Git tracks source code and enables collaboration. Use these daily for commits, branches, and syncing with remote.

Command	Description
<code>git init</code>	Initialize repo
<code>git clone <url></code>	Clone repo
<code>git status</code>	Check repo status
<code>git add .</code>	Stage changes
<code>git commit -m "msg"</code>	Commit changes
<code>git push origin main</code>	Push to remote
<code>git pull origin main</code>	Pull from remote
<code>git branch -b feature</code>	Create branch
<code>git merge feature</code>	Merge branch
<code>git log --oneline</code>	Compact history

3. Docker (Containers)

Docker packages apps into portable containers. These are must-use commands for dev, CI, and prod.

Command	Description
<code>docker --version</code>	Check version
<code>docker pull nginx</code>	Pull image
<code>docker images</code>	List images

Command	Description
<code>docker run -d -p 8080:80 nginx</code>	Run container
<code>docker ps</code>	Show running containers
<code>docker stop <id></code>	Stop container
<code>docker exec -it <id> bash</code>	Shell into container
<code>docker logs -f <id></code>	Follow logs
<code>docker build -t myapp .</code>	Build image
<code>docker push user/app:1.0</code>	Push image

4. Kubernetes (Orchestration)

Kubernetes manages containers at scale. These commands are daily bread for DevOps engineers.

Command	Description
<code>kubectl get nodes</code>	List cluster nodes
<code>kubectl get pods</code>	List pods
<code>kubectl describe pod <pod></code>	Pod details
<code>kubectl logs -f <pod></code>	Stream pod logs
<code>kubectl exec -it <pod> -- bash</code>	Exec into pod
<code>kubectl apply -f deploy.yaml</code>	Apply manifest
<code>kubectl delete pod <pod></code>	Delete pod
<code>kubectl get svc</code>	List services
<code>kubectl scale deployment web -- replicas=3</code>	Scale app
<code>kubectl rollout undo deployment/web</code>	Rollback

5. CI/CD Pipelines (Jenkins/GitHub Actions)

CI/CD automates builds, tests, and deployments. These commands define and control pipelines.

Command	Description
<code>jenkins-cli.jar -s <url> list-jobs</code>	List Jenkins jobs
<code>jenkins-cli.jar -s <url> build job</code>	Trigger job
<code>.github/workflows/ci.yml</code>	GitHub Actions config
<code>gh workflow run <workflow></code>	Run workflow manually
<code>git push origin main</code>	Trigger pipeline
<code>docker build .</code>	Build in pipeline
<code>docker push repo/app</code>	Push in pipeline
<code>kubectl apply -f k8s/</code>	Deploy in pipeline
<code>sonar-scanner</code>	Run code quality scan
<code>trivy image app:latest</code>	Container security scan

6. Cloud (AWS/Azure/GCP)

Cloud providers are core to DevOps. These are frequently used commands for provisioning and management.

Command	Description
<code>aws configure</code>	Setup AWS CLI
<code>aws s3 ls</code>	List S3 buckets
<code>aws ec2 describe-instances</code>	Show EC2s
<code>aws eks update-kubeconfig --name cluster</code>	Connect to EKS
<code>az login</code>	Azure login
<code>az group list</code>	Show resource groups

Command	Description
<code>az aks get-credentials --name cluster</code>	Connect to AKS
<code>gcloud auth login</code>	Google login
<code>gcloud compute instances list</code>	List instances
<code>gcloud container clusters get-credentials my-cluster</code>	Connect to GKE

7. Monitoring & Logging

Monitoring helps detect issues early. Use these for resource checks, metrics, and logs.

Command	Description
<code>top</code>	CPU/memory usage
<code>htop</code>	Interactive monitoring
<code>df -h</code>	Disk usage
<code>du -sh *</code>	Directory sizes
<code>kubectl top pods</code>	Pod resource usage
<code>kubectl get events</code>	Cluster events
<code>docker stats</code>	Container resource usage
<code>journalctl -u <service></code>	Service logs
<code>prometheus.yml</code>	Prometheus config
<code>grafana-cli plugins ls</code>	List Grafana plugins

8. Security Tools

Security must be baked into DevOps. These are must-use tools for secrets and scanning.

Command	Description
<code> snyk test </code>	Scan dependencies
<code> trivy image <image> </code>	Scan Docker image
<code> gitleaks detect </code>	Detect secrets in Git
<code> checkov -d . </code>	Scan IaC files
<code> vault kv put secret/db password=pass </code>	Store secret in Vault
<code> vault kv get secret/db </code>	Retrieve secret
<code> kubectl create secret generic creds </code>	Create K8s secret
<code> kubectl describe secret creds </code>	Inspect secret
<code> openssl genrsa -out key.pem 2048 </code>	Generate RSA key
<code> certbot certonly --standalone </code>	Get TLS cert

9. Infrastructure as Code (Terraform/Ansible)

IaC automates infrastructure provisioning. These commands are used daily for reproducible infra.

Command	Description
<code> terraform init </code>	Initialize Terraform
<code> terraform plan </code>	Preview infra changes
<code> terraform apply </code>	Apply changes
<code> terraform destroy </code>	Tear down infra
<code> ansible-playbook play.yml </code>	Run playbook
<code> ansible all -m ping </code>	Test connection
<code> ansible-vault encrypt file.yml </code>	Encrypt secrets
<code> ansible-vault decrypt file.yml </code>	Decrypt secrets

Command	Description
<code>packer build image.json</code>	Build machine image
<code>vagrant up</code>	Start Vagrant VM

10. DevOps Productivity & Utilities

Small but powerful helpers — aliases, YAML tools, and shortcuts that save hours in daily work.

Command	Description
<code>alias k=kubectl</code>	Shorten kubectl
<code>kubectl get pods -o wide</code>	Wide output
<code>yq e '.spec.template' file.yaml</code>	Parse YAML
<code>jq . file.json</code>	Parse JSON
<code>watch kubectl get pods</code>	Watch pods live
<code>grep "ERROR" app.log</code>	Filter logs
<code>find . -name "*.yaml"</code>	Find YAML files
<code>curl -I http://app</code>	Test endpoint
<code>dig example.com</code>	DNS lookup
<code>nc -zv host port</code>	Check TCP connectivity

Quick Reference (One Pager)

Category	Command	Description
Linux	<code>ls -l</code>	List files
	<code>tail -f file</code>	Follow logs
Git	<code>git clone <url></code>	Clone repo
	<code>git commit -m "msg"</code>	Commit

Category	Command	Description
	<code>git push origin main</code>	Push changes
Docker	<code>docker run -d -p 8080:80 nginx</code>	Run container
	<code>docker ps</code>	Running containers
	<code>docker logs -f <id></code>	Follow logs
K8s	<code>kubectl get pods</code>	List pods
	<code>kubectl logs -f <pod></code>	Stream logs
	<code>kubectl apply -f deploy.yaml</code>	Deploy YAML
CI/CD	<code>jenkins-cli build job</code>	Trigger Jenkins job
	<code>gh workflow run</code>	Trigger GitHub Actions
Cloud	<code>aws s3 ls</code>	List buckets
	<code>az aks get-credentials</code>	Connect to AKS
	<code>gcloud compute instances list</code>	GCP instances
Monitoring	<code>kubectl top pod</code>	Pod usage
	<code>docker stats</code>	Container usage
Security	<code>trivy image </code>	Scan image
	<code>gitleaks detect</code>	Find secrets
IaC	<code>terraform apply</code>	Apply infra
	<code>ansible-playbook play.yml</code>	Run playbook

Conclusion

DevOps brings together code, infrastructure, automation, and monitoring into a unified practice. This cheat sheet summarized the **100+ most used commands across Linux, Git, Docker, Kubernetes, CI/CD, Cloud, Monitoring, Security, and IaC.**

The **Quick Reference Table** helps with daily lookups, while the full guide provides context and best practices. With these essentials, you can build, deploy, monitor, and secure applications across any environment.

DevOps is not just about tools — it's about speed, reliability, and confidence. Master these commands, and you'll master the daily workflow of a DevOps engineer.
